In order to prepare for Presidio Parkway Phase II construction, crews will remove trees and vegetation along the project corridor.

Beginning the week of February 25, initial tree and vegetation removal will occur at the eastern end of the project to make room for the northbound Battery Tunnel, the Main Post tunnels and the future Girard Road interchange.

There will be additional tree and vegetation removal at the western end of the project in the coming months. Additional information and notification will be sent when the dates for this work are determined.

See the map below for general work areas and see the opposite page for more detailed tree removal areas.

Work will include tree and vegetation removal, stump grinding and root clearing. The tree material will be recycled or salvaged. Environmentally sensitive areas near the tree removal sites will be protected and erosion control measures will be in place.

Tree removal is necessary to clear and grade the site and create space for construction activities and staging areas. A Tree Removal and Protection Plan has been carefully developed in collaboration with certified arborists, landscape architects and the Presidio Trust forester to remove only the trees necessary.

The final design of the Presidio Parkway includes an extensive re-landscaping and tree replacement program.

Initial Tree & Vegetation Removal – Beginning the week of February 25

Future Tree & Vegetation Removal – Timeframe TBD
